

In the Claims:

1. (Original) A liquid crystal display device comprising:

an upper substrate on which are arranged an upper electrode for applying a voltage, and an upper alignment control layer formed on the upper electrode and performed an aligning treatment;

a lower substrate on which are arranged a lower electrode for applying a voltage in cooperation with the upper electrode, and a lower alignment control layer formed on the lower electrode and performed an aligning treatment in the same direction as the upper alignment control layer; and

monostable ferroelectric liquid crystals sealed between the upper alignment control layer and the lower alignment control layer, and forming a chevron-layer structure which is so bent that the inside from both sides of the upper and lower alignment control layers is protruded in the direction of the aligning treatment.

2. (Original) A liquid crystal display device according to claim 1, wherein the alignment control layers are organic polymer films without side chain alkyl structure.

3-10. (Cancelled)

Respectfully submitted,
